This Manual covers all the taxa of bacteria, and its approach is generalized for both pure and applied bacteriology. Aimed at senior undergraduate and beginning graduate science majors, at teachers and researchers, the Manual provides practical descriptions of laboratory procedures that are known to be reliable and that are in frequent use. It is an invaluable tool for all involved in bacteriology in the laboratory setting.

The book comprises six sections, each of which is self-contained, with its own table of contents to help the reader find specific methods as easily as possible. The contents are listed below.

METHODOLOGY FOR GENERAL BACTERIOLOGY

GROWTH—Biophysical Factors in Growth—Biochemical Factors in Growth—Enrichment and Isolation—Solid Culture—Liquid Culture—Growth Measurement—Preservation

GENETICS—Gene Mutation—Gene Transfer—Plasmids

METABOLISM—Physical Methods—Chemical Composition—Enzymatic Activity—Permeability and Transport

SYSTEMATICS—General Characterization—Numerical Taxonomy—Genetic Characterization

LABORATORY SAFETY—Sterilization—Containment and Disinfection

ADDENDUM—Diluents and Biomass Measurement

Napco® promises you:

No other water jacketed CO₂ incubator can match the new 6000 series.

Over 15 advanced features are making incubator history. Here are a few of them.

**More accurate control of chamber temperature.**
By positioning sensors not only in the water jacket, *but in each separate chamber*, Napco permits more precise chamber monitoring than other water jacketed incubators.

The only water jacketed CO₂ incubator you can get really clean. Shelf standards and plenums can be easily removed for cleaning in five minutes. This leaves an empty, perfectly smooth chamber that can be swabbed for easy management of spores and contaminating organisms.

**Unique wet-jet air flow system.**
The exclusive wet-jet air flow system provides maximum chamber uniformity and assures the highest relative humidity available in any incubator.

And the list goes on. Feature after feature are designed for your convenience and precision performance. Send for the complete brochure.

All Napco water-jacketed incubators are available in three space-saving models.

The most recent advances in spore science —

SPORULATION and
GERMINATION

EDITORS:
HILLEL LEVINSON
A. L. SONENSHINE
DONALD J. TIPPER

Proceedings of the Eighth International Spore Conference,
Woods Hole, Massachusetts, 9-12 October 1980

This book contains two kinds of papers — review articles and research papers — and reflects the high quality of the Conference at which advances in the applications of modern molecular genetics and biochemistry to persistent questions regarding sporulation and germination were presented.

The review articles, listed below, are authoritative, up-to-date, critical reviews of major areas written by leaders in their respective fields:

- Initiation of Bacterial Sporulation. Ernst Freese
- Biochemistry of Bacterial Forespore Development and Spore Germination. Peter Setlow
- Advances in the Genetics of Bacillus subtilis Differentiation. P. J. Piggot, A. Moir, and D. A. Smith
- Cloning Strategies in Bacillus subtilis. Paul S. Lovett
- Sigma Factors. Stage 0 Genes. and Sporulation. Richard Losick
- Biophysical Studies on the Molecular Mechanisms of Spore Heat Resistance and Dormancy. W. G. Murrell

The research papers are refereed and reflect the most recent advances in spore science, including material in molecular genetics and gene cloning. Well-documented experiments on important and interesting topics —52 in all — are arranged in the following six major topic areas:

- Genetics of Sporeforming Bacteria and Cloning of Sporulation Genes
- Initiation of Sporulation and Regulation of Metabolism
- Macromolecular Synthesis During Sporulation
- Dormancy. Germination. and Outgrowth
- Resistance of Spores
- Resting Forms of Microorganisms Other than Bacillus and Clostridium.

SPORULATION AND GERMINATION will be of particular interest in graduate and undergraduate departments of microbiology, university libraries, medical school libraries, and industrial laboratories, as a handy reference for all individuals involved in spore research, and as adjunct material for teaching courses that cover spore science.

Now you can choose the most suitable microcarrier for your culture

Cytodex microcarriers bring new opportunities to
- routine and experimental cell culture
- production of viruses, interferon and other cell products
- in vitro studies on differentiation and metabolism

**Cytodex 1**  The microcarrier proven to be effective for growing more than 100 different cell types.

**Cytodex 2**  Especially developed for better yields of viruses and cell products. Retains all the advantages of Cytodex 1 with the added benefit of new charged groups necessary for cell attachment localized only on the surface of the microcarriers.

**Cytodex 3**  The latest concept in microcarriers. The stable collagen surface gives improved attachment and yields of many cell types, especially those normally difficult to grow in culture. Enzyme digestion of the surface gives improved recovery and viability of harvested cells.
