*Cover photograph* (Copyright © 2008, American Society for Microbiology. All Rights Reserved.): Collapse of DNA replication forks can produce cruciform DNA structures, termed chicken feet, as represented in the foreground. We propose that the homologous recombination protein encoded by *Xrcc2* is important to repair such collapsed replication forks in developing lymphocytes. In the absence of *Xrcc2* function, chicken feet are sensed as unrepaired DNA double strand breaks (as revealed by staining for phosphorylated histone H2AX [upper left]), leading to S-phase arrest and eventually chromosomal damage (shown by karyotype analyses [lower right]).
