COVER IMAGE

Cover photograph: Four-channel confocal microscopy of a Nalm-6 B-ALL cell engineered to express the immunotherapy-resistant CD19 exon 2 variant 105R. The corresponding CD19 protein is rendered in green and shows colocalization with the endoplasmic reticulum marker calnexin (magenta), as evidenced by the chromatic shift to white at the colocalization sites. The plasma membrane is depicted in red (wheat germ agglutinin), and the cell nucleus is counterstained with DAPI (4',6-diamidino-2-phenylindole; blue). The Adobe Photoshop craquelure filter was applied to the image postoverlay. (See related article at e00383-18.) (Copyright © 2018 American Society for Microbiology. All Rights Reserved.)
